ROVA Model Validation – Query Log for the Model Owner: control set NIFA07-2026-08-10-10.19

From	Aishika Bhattacharya, Model Risk Management (UKRM), Handelsbanken UK
To	Nick Farmer (NIFA07), Model Owner, UKXD (UKOX-D) Fraud Analytics
Model	ROVA – real-time fraud screening of outbound payments (UK control set)
Change reviewed	Control set NIFA07-2026-08-10-10.19 (accepted 12/08/2026): adjustment to scenarios **RSK RED P UHAMT** and **RSK RED C CVOL CrsBrdMinAmnt**
Follows	ROVA Query Log v1 (IDs 1–18)
Date issued	12 October 2026
Status	Draft for discussion
Response requested by	[date to be agreed]

1. About this document

1.1 Purpose

This log sets out the questions MRM needs UKXD to answer on the second sampled change: control set NIFA07-2026-08-10-10.19, which adjusted two live scenarios. Each query explains the background in plain language, describes the issue, quotes the exact wording or data where the issue was found, gives a precise reference, states any assumption MRM has made, and lists the questions for UKXD.

1.2 What the change did, in plain language

- **RSK RED P UHAMT** (private customers). This scenario holds a payment over £10,000 when the customer has already paid the same new, unknown beneficiary earlier that day. It had raised about 90–140 false alerts a month (March–July 2026) and, according to the change document, no fraud for four months. The change keeps it live only "out of hours" (stated as 10pm to 9am). During the day it no longer alerts.
- **RSK RED C CVOL CrsBrdMinAmnt** (corporate customers, cross-border payments). This scenario holds a burst of small cross-border payments (up to about £5,000 each) to new beneficiaries. Before the change it alerted when more than five such payments were made within four hours. The change adds a second condition: the total sent to new beneficiaries in those four hours must also exceed £10,000. The scenario was built for a risk that has not been seen in practice ("theoretical risk scenario").

Both changes reduce alerting. Both were approved by the CFCPO (11/08/2026) with MLRO oversight (12/08/2026).

1.3 How this log relates to Query Log v1 – only open points are raised

UKXD answered IDs 1–17 of Query Log v1. Those answers have been **taken as given** and are not asked again. Section 4 lists the answers this log relies on and how they are used. Several queries below build on an answer, for example by applying the Hour of Day logic UKXD explained in ID 5 to this scenario's configuration. In those cases the query asks only about the new point.

Points from v1 that are still unanswered or only partly answered, and that bear on this change, are in Section 7. These are: ID 18 (approvals; no reply), ID 11 (STOP-list look-ahead in simulations; not addressed), ID 5 (clock and BST; "to be raised with Group") and ID 14 (post-change review; "planned").

Queries in MRM's earlier draft log that were not raised in v1 are not repeated here. Where a query below is related to one of them, the earlier draft ID is given in the summary table for cross-reference only.

1.4 What MRM reviewed and what it could not review

MRM reviewed the documents in Section 3, re-performed the calculations in the change data workbook from its raw data, and compared the change evidence with the ROVA Bi-Weekly Metrics workbook. MRM does not have access to the ROVA system, its configuration screens or code. Where a query depends on how ROVA behaves internally, MRM is asking UKXD to explain it, provide evidence, or run a test on MRM's behalf.

This is the second sampled change; the first was the June HAmntDev change. Scenario documents differ from change to change. MRM has not assumed that an issue found here applies to other scenarios unless the evidence shows it does. Where it may, the query is labelled "Change → model-wide".

1.5 How the queries are organised

Group	Covers	Query IDs
UH	RSK RED P UHAMT: active hours, residual risk of the daytime removal, fraud evidence	UH-1 – UH-3
CB	RSK RED C CVOL CrsBrdMinAmnt: how it is built, the £10K materiality, corporate cross-border fraud coverage, the corporate "holds only" policy, post-change results	CB-1 – CB-5
GV	Both scenarios: retaining scenarios that detect no fraud, approval timing and documents, reproducibility of figures, scenario descriptions, data handling	GV-1 – GV-5
CF	Carried forward from Query Log v1 (unanswered or partly answered)	CF-1 – CF-4

Labels used with each query:

- **Scope.** *Change*: about this change only. *Change → model-wide*: found in this change, but the question applies to the model as a whole.
- **Priority.** *High*: needed before testing of this change can be concluded. *Medium*: needed before the validation report is finalised. *Low*: improvement point.
- **Validation component.** The component used in the v1 log (Model Framework, Model Controls, Predictive Ability and Backtesting, Implementation and Use, Data), so that queries can be copied into the Excel log.

1.6 How to respond

Please answer under each query number. Where the answer is a document or data extract, please give the file name and the location of the relevant part. Where a question needs Group input, please say who will answer it and by when.

2. Key terms used in this log

Term	Meaning
Scenario	A rule in ROVA that combines several conditions ("instances"). For example, "new beneficiary less than 2 days old" and "payment over £10K".
Instance, ladder	A control with a limit, such as "TrntoNB >5". Several limits on one control (>5, >10, >25…) form a ladder.
HOLD / STOP	A HOLD pauses the payment for review by the Payment Verification Team. A STOP stops it. UKXD (v1 ID 1): a total score above 100 gives HOLD, and above 900 gives STOP.
CVAL codes	Outcome labels (v1 ID 9). Fraud: C3 held-stopped, C4 stopped, C41 machine-stopped, C2 held-released (fraud let through after review), C1/C11 missed. Genuine: C7 held-released, C8 held-stopped, C6 stopped, C61 machine-stopped, C5/C51 not interrupted.
FP / TP	False positive (a genuine payment alerted) and true positive (a fraud alerted). Counted per payment (v1 ID 9).

Term	Meaning
Crossover	The share of a scenario's alerts on payments that another scenario also alerted on.
OOH	Out of hours. Here, the stated period is 10pm to 9am.
Hour of Day instances	Instances <9, <10, <13, <17, <22, <23 and <24. Per UKXD (v1 ID 5), each selected instance covers the hour band from the previous instance up to its own value, and selected bands are combined with OR.
BRT	The Board risk tolerance for external fraud losses; the only bank-set metric for ROVA (model documentation §1.6).
Min amount	The payment value below which ROVA does not raise a HOLD. For corporate cross-border payments it is now £0.96 (change document, page 3).
Raw Alert Data	Sheet in the change data workbook: one row per payment per scenario alerted, for payments that hit RSK RED P UHAMT between 1 July and 9 August 2026.

3. Documents referred to

Short name used in this log	Full document name (file)	What it contains	Dated	Pages / sheets
Change document	2026-08-12 P UHAMT & C CVOL CrsBrd MinAmnt (.docx)	Summary, rationale, crossover and fraud tables, change impact, sign-offs, simulation screenshots, appendix	Sign-offs 10–12/08/2026; no document date	14 pages when rendered to PDF; page numbers in this log refer to that rendering
UHAMT proposal	RSK RED P UHAMT_Proposal_2026-09-15.pdf	Summary, fraud description, evidence of fraud, scenario logic, 8 simulations	"Date produced: 2026-09-15"	29 pages
CVOL proposal	RSK RED C CVOL CrsBrdMinAmnt_Proposal_2026-09-15.pdf	As above for CVOL CrsBrdMinAmnt; the same 8 simulations	"Date produced: 2026-09-15"	29 pages

4. What UKXD has already told MRM (Query Log v1) and how this log uses it

v1 ID	What UKXD told MRM	How this log uses it
1	The total score decides the outcome: above 100 points is HOLD and above 900 is STOP. Some instances add 1 point each and some controls add 1 point as a whole. Scenario_threshold is the criterion for a scenario to trigger.	Not asked again. CB-1 asks only for this scenario's threshold and points. UH-2 relies on the scoring being cumulative.
4	Thresholds are held in SEK, converted from round SEK figures; a conversion process is planned under JIRA UKFCDA-5691.	Not asked again. CB-2 notes that the "£10K" materiality therefore moves with the exchange rate.
5	Hour of Day: selected instances are combined with OR, and each covers the band up to its value. ROVA is "in CET time (we think)". BST handling "to be raised with group". The validation report wording is to be clarified under JIRA UKFCDA-7090.	The band logic is applied to UHAMT in UH-1. The open clock/BST point is in CF-3.
6	The validation CSV is produced for every change. The UKXD Thresholds Verified sign-off accepts the report. The front end is checked by a second user. Role segregation applies.	Not asked again. GV-2 asks only about the timing of this change's documents.
8	The pivot error was a coding error that "likely… occurs in a few changes". Evidence will be standardised in Q1 2027.	GV-3 asks for the corrected figures for this change and for interim checks, not about the cause.
9	Counting is at payment level. FN is not saved at scenario level. CVAL code mapping provided.	Used for the CVAL codes in the simulations and MI. CB-2 relies on FN not being saved at scenario level. GV-3 relies on payment-level counting.
10	"We try to build scenarios to what we see as opposed to theoretical cases". The <8-day limit followed stakeholder preference.	GV-1 compares this principle with the CVOL scenario, which is described as theoretical.
11	Branch/customer-connect payments are out of scope. Beneficiaries are green-listed after 15 days. The join on table K28A1400 was fixed in October 2026. The STOP-list question ("Is it true?") was not answered.	Not asked again except the STOP-list point (CF-2).
14	A post-change review is planned (JIRA UKFCA-5915), and UKXD would welcome MRM guidance. Test scenarios raise live holds.	CB-5 uses this change's September results. CF-4 gives MRM's expectations for the review.
16, 17	Frauds are reported on average within 5 days, and data is typically static after about a month. The fall in fraud volumes is real.	Used to treat July–September monitoring figures as mature enough to use.

5. Summary of queries

ID	Query	Scenario	Priority	Builds on (v1 / earlier draft)
UH-1	Configured active hours do not match the approved "10pm–9am"	P UHAMT	High	v1 ID 5; draft A5
UH-2	Daytime coverage removed: residual risk not assessed; crossover is not coverage	P UHAMT	High	draft A9
UH-3	Fraud evidence: the March 2026 true positive, case FRD0002290 and no fraud simulation	P UHAMT	High	draft B5
CB-1	How the scenario is built: per-payment band, count rule and aggregation	C CVOL CrsBrdMinAmnt	High	v1 ID 1
CB-2	The £10K materiality does not cap exposure at £10K, and the link to BRT is not shown	C CVOL CrsBrdMinAmnt	High	v1 IDs 4, 9; draft C7
CB-3	Corporate cross-border fraud coverage: 3 of 5 frauds in the change's own evidence were missed	Corp cross-border	High	draft C5
CB-4	Corporate "holds only" policy: no change record, and STOPs before August	Corp scenarios	Medium	–
CB-5	September results do not match the forecast reduction	C CVOL CrsBrdMinAmnt	Medium	v1 ID 14
GV-1	Retaining scenarios that detect no fraud: no criteria, owner or review date	Both	Medium	v1 IDs 10, 17; drafts C6, E5
GV-2	Documents dated or edited after approval; checklist blank; validation timing	Both	High	v1 ID 6; draft E7
GV-3	Figures in the change evidence cannot be reproduced	Both	Medium	v1 IDs 8, 9; draft E11
GV-4	Scenario descriptions do not match the configuration	Both	Medium	draft F5

ID	Query	Scenario	Priority	Builds on (v1 / earlier draft)
GV-5	Customer-identifiable data in the change evidence	Both	Low	–
CF-1	Approvals by change type (v1 ID 18, unanswered)	Model-wide	High	v1 ID 18
CF-2	STOP-list look-ahead in simulations (v1 ID 11, unanswered part)	Model-wide	High	v1 ID 11
CF-3	ROVA clock and BST (v1 ID 5, open with Group)	Model-wide	High	v1 ID 5
CF-4	Post-change review: MRM's expectations (v1 ID 14, planned)	Model-wide	Medium	v1 ID 14

6. Detailed queries

Group UH. RSK RED P UHAMT

UH-1. Configured active hours do not match the approved "10pm–9am"

Scope: change → model-wide · Priority: High · Validation component: Model Controls

What this is about. The change keeps UHAMT live only out of hours, which the documents state as 10pm to 9am. ROVA sets active hours by ticking Hour of Day instances. In v1 ID 5, UKXD explained that each ticked instance covers the hour band from the previous instance up to its own value, and that ticked bands are combined with OR. The available instances are <9, <10, <13, <17, <22, <23 and <24. Applied to this configuration, that logic gives the scenario's actual live hours.

The issue. Only <9 and <24 are ticked. Using UKXD's band logic, <9 covers 00:00–08:59 and <24 covers 23:00–23:59 on ROVA's clock. The <23 band (22:00–22:59) is not ticked. The configured window is therefore 23:00–08:59 on ROVA's clock, not 22:00–08:59.

ROVA's clock is not confirmed (v1 ID 5: "CET time (we think)"). Sweden is one hour ahead of the UK all year, because both change to summer time on the same dates. So the gap falls in a different hour depending on the clock:

- If ROVA uses UK time, the window is 23:00–08:59 UK. The 10pm hour is missing.
- If ROVA uses Swedish time, the window is 22:00–07:59 UK. The 8am hour is missing.

Neither matches the approved window. The difference matters for this scenario. Of the 176 payments UHAMT alerted between 1 July and 9 August, 21 fall in 22:00–08:59 by timestamp, 19 in 23:00–08:59, and 12 in 22:00–07:59. The 8am hour alone has 9 alerts, the most of any hour in the window. So the choice of clock changes UHAMT's remaining coverage by almost half.

The validation report records the gap as a fail, which was accepted with a general justification that does not state the hours. The same <9 + <24 pattern, with the same justification, is used by eight other out-of-hours scenarios in this control set. The question therefore applies beyond UHAMT.

Where it is (exact wording).

> "Following Changes in NIFA07-2026-08-10-10.19 this scenario was set to out of hours periods only (10pm-9am)."
> — UHAMT JSON, field "fdesc" (same text in UHAMT proposal, page 2, "Fraud Description")
>
> "The rule will be kept live for OOH periods (10pm – 9am)"
> — Change document, page 3, paragraph after the "Hits" table

> RSK RED P UHAMT, Hour of Day <9, missing_values "[10.0, 13.0, 17.0, 22.0, 23.0]", Fail, "Scenario is intended to be active for specific OOH period."
> — Validation CSV, row 465 (Validation report, page 27, "Fails")
>
> "Accepted Pass - all scenarios with banding are as designed."
> — Validation report, page 26, heading of the "Fails" section
>
> "Hour of Day <24" and "Hour of Day <9" (no other Hour of Day instance)
> — UHAMT proposal, page 3, "Scenario Logic"

Detailed references.

- Validation report page 5: list of Hour of Day instances in the control set (<10, <13, <17, <22, <23, <24, <9).
- Validation CSV row 479 (UHAMT, Hour of Day <24, Pass); row 465 (UHAMT, Hour of Day <9, Fail). Validation report page 24 (UHAMT rows) and page 27 (fail).
- Validation report pages 26–27: the same fail and justification for ABNM RSK P HAmntDev OOH, EXPA P UVOL OOH, FM01 K ABNM P 5, 6, 7 and 8, RSK RED P CVAL OOH and RSK RED P CVOL OOH.
- Change data workbook, sheet "Raw Alert Data", column E "EFFTMSTP": 176 distinct UHAMT payments, 1 July – 9 August 2026. Count by hour: 22:00 = 2, 01:00 = 3, 04:00 = 2, 06:00 = 1, 07:00 = 4, 08:00 = 9, and no alerts at 23:00 or 00:00.
- Query Log v1, ID 5, developer reply (band logic, clock, JIRA UKFCDA-7090).
- Simulation evidence that may show the clock: UHAMT proposal pages 5–7 (SRCHID 13440209, Priv Faster Payments, 6 August). One genuine stopped payment (C6) became OK in the simulation. The two UHAMT-alerted C6 payments that day in "Raw Alert Data" are TXNID 41506612587 at 08:50 (£10,000; 5 scenarios hit) and TXNID 41507542452 at 17:22 (£99,000; 9 scenarios hit). If the 08:50 payment is the one that became OK, the 8am UK hour is outside the configured window.

Assumptions MRM has made. MRM has applied the band logic exactly as UKXD described it in v1 ID 5. MRM has assumed that EFFTMSTP in the data extract is UK local time. Neither assumption is confirmed.

Questions for UKXD.

1. Please state UHAMT's intended live hours in UK local time.
2. Using the band logic in v1 ID 5, please confirm that the configuration covers 23:00–08:59 on ROVA's clock. If the 10pm hour was intended, why is <23 not ticked?
3. Which clock does EFFTMSTP in the DACO extract use? Is it the same clock as ROVA's Hour of Day control?
4. For simulation 13440209 (6 August), which payment changed from C6 to OK? Please also list the payments that changed outcome in simulation 13440235 (5 August), which includes TXNID 41505066348 at 08:39.
5. Please provide the hour-of-day distribution, in UK time, of UHAMT alerts since 12 August 2026. This would show the window in operation.
6. Please confirm the live hours in UK time of the eight other out-of-hours scenarios listed above. Do they match their intended windows?

UH-2. Daytime coverage removed: residual risk not assessed, and crossover is not coverage

Scope: change · Priority: High · Validation component: Predictive Ability and Backtesting

What this is about. Removing a scenario during the day is acceptable if other scenarios still catch the same pattern during the day. The change document supports this with a "crossover" figure: about 75% of UHAMT's false alerts were also hit by another scenario. Two things need checking. First, does crossover show that a payment would still be held without UHAMT? Second, what happens to the payments that only UHAMT caught?

The issue.

(a) Payments only UHAMT caught. MRM re-performed the crossover from "Raw Alert Data", counting each payment once. Of 176 UHAMT payments (1 July – 9 August), 137 (77.8%) were also hit by another scenario. The other 39 were caught by UHAMT alone. 31 of those 39 were made between 09:00 and 21:59, so they would not now be alerted. Their median value is £19,750 and their total is about £1.37 million. All 39 were genuine (C7), so no loss arose. The point is the pattern that is no longer covered during the day: a second payment of more than £10,000 to a new beneficiary on its first day.

(b) Crossover is not coverage. Under UKXD's description of scoring (v1 ID 1), a payment is held only when its total score passes 100. A second scenario hitting the same payment does not mean it would be held on its own. The simulations show that some payments with a second hit were in fact released when UHAMT was removed:

- 5 August, Priv Faster Payments: the simulation removes 3 holds. Only 1 UHAMT payment that day was hit by UHAMT alone (11:20).
- 6 August, Priv Faster Payments: the simulation removes 6 alerts. Only 3 UHAMT payments that day were hit by UHAMT alone during the day (09:19, 12:23, 12:36).
- 7 August, Priv Faster Payments: the simulation removes 1 hold, although every UHAMT payment that day was also hit by another scenario.

On these days, at least 2, 3 and 1 payments with a second scenario hit were released without UHAMT. So the 75% figure overstates how much of UHAMT's daytime coverage remains.

(c) No headroom analysis. The fraud description calls UHAMT a backstop that "kicks in earlier" than the other RSK RED scenarios. On MRM's reading of the instance names, the nearest daytime controls are RSK RED P UVOL GEN (CounttoBene1Day >2, i.e. three or more payments to the same beneficiary in a day) and RSK RED P UVAL GEN (SumtoBene1Day >£25K). Two payments of £10,000–£14,999 to a new beneficiary in one day (total up to about £25K) would meet neither. RSK RED P CVAL has an AmnttoNB >£10k instance, but its other conditions are not in the pack. No analysis shows what a private customer can now send to a new beneficiary on day 1, in daytime, before any scenario alerts.

Where it is (exact wording).

> "This can be seen in the below data where approx. 75% of false positive alerts on RSK RED P UHAMT also alert on a separate or alternative scenarios"
> — Change document, page 2, paragraph above the "Hits" table
>
> "This scenario works in conjunction with the other RSK RED scenarios but kicks in earlier due to focus on high value payments."
> — UHAMT JSON, field "fdesc"; UHAMT proposal, page 2
>
> "This scenario's design was not inspired by any particular case and is acting as a backstop type scenario."
> — UHAMT JSON, field "evid_desc"; UHAMT proposal, page 2
>
> "This is done because we now have both duplicate rules in place for extremely rapid examples of the same payment and then the RSK RED CVOL/CVAL or RSK RED UVOL/UVAL rules which limit was customers/users can do in rolling 4 hour or rolling 24 hour periods to new benes or specific benes."
> — Change document, page 1, "Summary", paragraph 1

Detailed references.

- Change data workbook, sheet "Raw Alert Data" (784 rows; 695 distinct rows; 176 distinct UHAMT TXNIDs). MRM's count of scenarios per TXNID gives 39 payments hit by UHAMT only.
- Change data workbook, sheet "Scenario Crossover", A1:D66 (daily UHAMT crossover, 1 June – 9 August): 205 of 268 = 76.5%.
- UHAMT proposal: pages 11–12 (SRCHID 13440235, 5 August: C7 20 → OK 3), pages 5–6 (SRCHID 13440209, 6 August: C6 5 / C7 29 → OK C6 1, C7 5), pages 20–21 (SRCHID 13441511, 7 August: C6 7 / C7 24 → OK C6 1).
- Raw Alert Data, UHAMT Priv Faster Payments: 5 August, 4 payments (UHAMT only: TXNID 41505307253). 6 August, 7 payments (UHAMT only in daytime: 41506645860, 41506963348, 41506990571). 7 August, 5 payments, none UHAMT only.

- Validation CSV rows 489 (RSK RED P UVOL GEN, CounttoBene1Day >2) and 502 (RSK RED P UVAL GEN, SumtoBene1Day >£25K); rows 413–448 (RSK RED P CVAL, AmnttoNB ladder).

Assumptions MRM has made. MRM has assumed that "Raw Alert Data" holds every payment UHAMT alerted between 1 July and 9 August. MRM has read the scenario conditions from instance names, because scenario thresholds and points are not in the pack.

Questions for UKXD.

1. For the 39 payments alerted by UHAMT alone, and for the payments removed in the 5–7 August simulations, what would the new control set have done with each? Please give the outcome and, where held, the scenario responsible.
2. Please provide a headroom analysis: the largest amount, and the payment pattern, that a private customer can send to a new beneficiary on its first day, during the day, without any alert after this change. Please split by Faster Payments, CHAPS and cross-border.
3. Was the loss of daytime coverage for this pattern presented to the CFCPO and MLRO as a residual risk? Where is that acceptance recorded?
4. Please explain why the crossover of false positives was used as evidence of continued fraud coverage, rather than a simulation of the pattern UHAMT targets.

UH-3. Fraud evidence: the March 2026 true positive, case FRD0002290, and no fraud simulation

Scope: change · Priority: High · Validation component: Predictive Ability and Backtesting

What this is about. When a change reduces alerting, the key test is whether frauds that were caught before would still be caught. That is normally shown by running known frauds through the new control set. The June HAmntDev proposal had a "Fraud Single Payment Simulations" section. Neither proposal for this change has one.

The issue.

(a) The window chosen leaves out the only fraud. The change document says UHAMT has produced only false positives for "4+" months, and its FP-ratio tables cover April to July/August. The metrics workbook shows that UHAMT had one true positive, a STOP, in March 2026. That is the month before the window shown, and the only true positive in the six months of data in the workbook (March–September).

(b) Case reference conflicts with the evidence description. The evidence field lists case FRD0002290 but says the scenario was "not inspired by any particular case". It is not explained what FRD0002290 is, or whether it is the March true positive.

(c) The simulations contain no fraud. All private-customer simulations (5–7 August) have zero fraud outcomes (C1, C11, C2, C3, C4 and C41 all 0.0). So the statement that the change does not affect fraud detection has not been tested for UHAMT. One corporate fraud does appear (CB-3, CF-2), but UHAMT does not apply to corporate customers.

Where it is (exact wording).

> "The active hours for the RSK RED P UHAMT scenario are reduced given its poor fraud detection performance and 4+ month period of only generating false positives."
> — Change document, page 1, "Summary", paragraph 1
>
> "Over the past four months, the RSK RED P UHAMT rule has not identified any actual instances of fraud. … The rule was originally added in Jan 2026"
> — Change document, page 1, "RSK RED P UHAMT", paragraph 1
>
> "RSK RED P UHAMT | Last Month -6 | 1 | TP | STOP"
> — Metrics workbook, sheet "6month rule data", row 423 ("Current Month" = 2026-09, so "Last Month -6" = March 2026)

> "This scenario's design was not inspired by any particular case and is acting as a backstop type scenario." Cases: "FRD0002290", "N/A", "N/A", "N/A", "N/A"
> — UHAMT JSON, fields "evid_desc" and "cases"; UHAMT proposal, page 2

Detailed references.

- Change document page 1: FP-ratio tables (August/July/June/April and July/June/May/April); none includes March.
- Metrics workbook, "6month rule data": UHAMT FP rows 19 and 540 (March: 58 HOLD, 39 STOP), row 423 (March TP). "Metric Data" row 2 confirms "Current Month" is 2026-09.
- UHAMT proposal pages 5–22: six private-customer simulations; every fraud column is 0.0. Pages 4–28: no fraud single-payment simulation section.
- June HAmntDev proposal, pages 4–5: "Fraud Single Payment Simulations" (the comparison).

Assumptions MRM has made. MRM has assumed that "Last Month -6" in the metrics workbook is March 2026, counting back from "Current Month" = 2026-09.

Questions for UKXD.

1. Please give details of the March 2026 true positive: date and time (UK), payment method, amount, and the other scenarios it hit. Would the new control set still have stopped it?
2. What is FRD0002290? Is it the March true positive, and why is it listed when the evidence field says no case inspired the scenario?
3. Please run a fraud single-payment simulation of the new control set against (a) every fraud UHAMT has alerted since January 2026, and (b) all private-customer frauds of more than £10,000 to beneficiaries under 2 days old in the last six months.
4. Why was the FP-ratio window in the change document started in April?

Group CB. RSK RED C CVOL CrsBrdMinAmnt

CB-1. How the scenario is built: per-payment band, count rule and aggregation

Scope: change · Priority: High · Validation component: Model Controls

What this is about. After the change, the scenario is described as holding a corporate customer's cross-border payment when, within four hours, more than five payments of up to about £5,000 each have gone to new beneficiaries and their total exceeds £10,000. To check that the configuration does this, MRM needs to see where each condition sits in ROVA and how the conditions combine.

The issue.

(a) The £5,000 per-payment cap is not visible. The scenario logic has no £5K instance. The only amount condition is "HighAmountDT 0 - CorpCrsBrdMinAmnt", a band named after the corporate cross-border minimum amount. The change document says that minimum is now £0.96. If the band's upper limit really were the minimum amount, the scenario could hardly ever fire, yet it raised 34 alerts in September. So the band must be set some other way, and that is not documented. The band has no "<" or ">" in its name, so the validation script does not check it (report page 7). The one condition that defines this scenario's population is therefore not covered by any automated check.

(b) The count rule is described three ways. The JSON says "5 or more". The change document says "more than five". The configuration is TrntoNB >5, i.e. six or more.

(c) How the conditions combine is not stated. The scenario has two ladders: TrntoNB >5, >10, >25, >50, >100 and AmnttoNB >£10k up to >£1m. UKXD has explained (v1 ID 1) that some instances add a point each and that a scenario fires when its threshold is met. MRM cannot tell from the pack whether this scenario needs both TrntoNB >5 and AmnttoNB >£10k. If ladder rungs add points, a high count alone (for example 26 or more very small payments) or a high amount alone could reach the threshold. In that case the £10K materiality would not apply as described.

(d) What is counted is not defined. It is not stated whether TrntoNB and AmnttoNB:

- include the payment being screened;
- use a rolling four-hour window (the instance names give no window);
- count all payment methods or cross-border only;
- define a "new" beneficiary as under 2 days old (as NewBeneDays <2 does for the current payment) or as not yet green-listed (15 days, v1 ID 11).

Where it is (exact wording).

> "This adjustment will trigger an alert when more than five payments are made to new beneficiaries within a four-hour window, with each payment between £0 and approximately £5k, and the total cumulative value exceeding £10k."
> — Change document, page 3, "RSK RED C CVOL CrsBrdMinAmnt", paragraph 2
>
> "This scenario is looking for Corp payments in <5K value range, to new (less than 2 days old) and unknown beneficiaries. The threshold of payments to new beneficiaries in a rolling 4 hours must also be 5 or more and the value to new bene's in that same period has exceeded 10k."
> — CVOL JSON, field "fdesc"; CVOL proposal, page 2
>
> "HighAmountDT 0 - CorpCrsBrdMinAmnt"
> — CVOL proposal, page 3, "Scenario Logic"
>
> "Since then the min amount for Crop cross border has been dropped to 0.96p such that nearly all payments are in scope of the rules (99.94%)"
> — Change document, page 3, "RSK RED C CVOL CrsBrdMinAmnt", paragraph 1
>
> "This validation results has only assessed controls that have atleast one instance used in a scenario and contain the > or < inequalities."
> — Validation report, page 7

Detailed references.

- CVOL proposal page 3: 21 instances (AmnttoNB ladder, ChannelINET/MOBI/TPP, Green List <1, HighAmountDT 0 - CorpCrsBrdMinAmnt, NewBeneDays <2, NumberAuthorizers <2, PytMtd - CpCrsBrdr, TrntoNB ladder).
- Validation CSV rows 96, 185, 367, 375, 384, 393, 402, 414, 418, 422, 427, 432, 438, 444, 450, 454 (all Pass). There is no HighAmountDT row. Validation report page 19.
- Change log row 4: "Scenario RSK RED C CVOL CrsBrdMinAmnt updated" at 10:27:07, eight minutes after the control set was created (see GV-2).
- Metrics workbook, "Rule Data", row 228: CVOL CrsBrdMinAmnt, Current Month (September), 34 FP.

Assumptions MRM has made. MRM has assumed that the 10:27 edit in the change log is the final configuration, and that the proposal's scenario logic (produced on 15 September) reflects it.

Questions for UKXD.

1. What are the actual limits of "HighAmountDT 0 - CorpCrsBrdMinAmnt", in SEK and in GBP? Is it linked to the minimum-amount parameter, and if so how, given that parameter is now £0.96?
2. What are this scenario's Scenario_threshold and the points from each instance? Does an alert need both TrntoNB >5 and AmnttoNB >£10k?
3. Please define TrntoNB and AmnttoNB: whether they include the current payment, the window, the payment methods counted, and the definition of "new beneficiary".
4. Which count is intended: five or more, or more than five? Please correct the JSON or the configuration.
5. What was changed at 10:27:07 on 10 August?

CB-2. The £10K materiality does not cap exposure at £10K, and the link to BRT is not shown

Scope: change · Priority: High · Validation component: Model Framework

What this is about. The change accepts some extra fraud risk in return for fewer false alerts. The documents describe that extra risk as "up to £10K" and "manageable within the BRT limits". MRM needs to understand how large the accepted risk really is and who accepted it.

The issue.

(a) The window repeats. The £10,000 test is applied within a rolling four-hour window. A single-authoriser user who keeps each four-hour burst under £10,000 is never alerted by this scenario. Six such windows fit in a day, so the extra exposure from this change alone could be up to about £60,000 per customer per day, not £10,000.

(b) Five payments were never caught. The count condition needs six or more payments. So five payments of up to about £5,000 each (about £25,000 in four hours) were not caught by this scenario before the change and are not caught now.

(c) Other corporate scenarios work per beneficiary. On MRM's reading, RSK RED C UVOL GEN (CounttoBene1Day >3) and RSK RED C UVAL GEN (SumtoBene1Day >£50K) count per beneficiary. A pattern spread across several new beneficiaries may therefore stay below them as well.

(d) No figures are given. There is no calculation of the worst-case unalerted amount, no BRT figure and no share of BRT. The limit is held in SEK (v1 ID 4), so "£10K" moves with the exchange rate.

(e) The trigger to revisit the limit relies on information ROVA does not keep. The document says the limit may be reduced "if we observe fraudsters exploiting these limits". Misses are not saved at scenario level (v1 ID 9), so it is not clear how such exploitation would be seen.

Where it is (exact wording).

> "this comes with an acceptance that a slight increase in potential loss (up to £10K) could occur"
> — Change document, page 1, "Summary", paragraph 2
>
> "The value of 10k was chosen as a reasonable materiality factor based on the fact that losses below this value are manageable within the BRT limits."
> — CVOL JSON, field "fdesc"; CVOL proposal, page 2
>
> "The £10k threshold caps potential losses at a manageable level and was chosen as a compromise between managing fraud losses and impact genuine customers. However, this limit may be adjusted or reduced if we observe fraudsters exploiting these limits."
> — Change document, page 5, paragraph below the crossover table
>
> "In most other cases we would historic fraud pattern to set this threshold but given the pattern this rule is detecting hasn't occurred this couldn't be done."
> — Change document, page 3, "RSK RED C CVOL CrsBrdMinAmnt", paragraph 3

> "losses should be minimised and maintained where possible within the Bank's external fraud Board risk tolerance (BRT) – this is the only Bank set metric for the ROVA/Fraud systems."
> — Model documentation, §1.6 Performance expectations

Detailed references.

- CVOL proposal page 3 (NumberAuthorizers <2: single-authoriser payments only).
- Validation CSV rows 491 (RSK RED C UVOL GEN, CounttoBene1Day >3) and 503 (RSK RED C UVAL GEN, SumtoBene1Day >£50K).
- Query Log v1, ID 4 (SEK thresholds) and ID 9 ("At scenario level we do not get FN as miss results are not saved").
- The change document gives no alternatives (for example £5K or £25K) with their effect on false positives.

Assumptions MRM has made. MRM's £60,000-a-day figure is a theoretical upper bound for this scenario alone. It assumes the four-hour window is rolling and that no other corporate scenario fires. It is not a loss estimate.

Questions for UKXD.

1. Please give the largest amount a single-authoriser corporate user can send cross-border to new beneficiaries in 4 hours and in 24 hours, after this change, without any corporate scenario alerting.
2. What BRT figure was used for "manageable within the BRT limits", and what share of it could this exposure take?
3. Were other materiality levels considered? Please give their simulated effect on false positives.
4. How will UKXD detect that fraudsters are exploiting the limit, given that misses are not recorded at scenario level?
5. Where is the CFCPO's acceptance of this residual risk recorded? Did it state the exposure in (1)?

CB-3. Corporate cross-border fraud coverage: 3 of 5 frauds in the change's own evidence were missed

Scope: change → model-wide · Priority: High · Validation component: Predictive Ability and Backtesting

What this is about. To show that the change does not affect fraud detection, the change document lists the corporate cross-border frauds of the last six months and notes that none fits this scenario. The same table also shows how ROVA as a whole dealt with those frauds.

The issue. Of the five corporate cross-border frauds listed, all single payments to a single beneficiary:

- three were missed: £60,571, £143,430 and £18,020, a total of £222,021;
- one was held and then released as genuine after review: £34,215;
- one was held and stopped: £19,919.

By value, about 80% was missed. The document uses the table only to show that the frauds are out of scope for this scenario. It does not discuss the gap the table reveals. That gap is single, higher-value corporate cross-border payments to new beneficiaries, which is what the corporate backstops (RSK RED C BACKSTOP CrsBrd and CrsBrd 2) appear to be designed for.

The document also says the frauds were of "value far higher than this scenario covers". Two of them were under £20,000. The table has no dates or transaction IDs, so the frauds cannot be traced or matched to the corporate fraud in the 6 August simulation.

Where it is (exact wording).

> "Furthermore in the previous 6 months the Corp cross border fraud seen has all been single payment examples and value far higher than this scenario covers and hence are not in-scope of this scenario, additionally this scenario has not detected any fraud in the approx. 2.5 months it has now been active."
> — Change document, page 4, first paragraph
>
> custipidfr 119458701, value £60,571, Missed-vol 1 · 106273600, £143,430, Missed-vol 1 · 127006500, £34,215, Detected - Released- vol 1 · 144174026, £18,020, Missed-vol 1 · 101138501, £19,919, Detected - Stopped- vol 1
> — Change document, page 4, fraud table (also change data workbook, sheet "Cross Border Fraud", rows 2–6)

Detailed references.

- Change data workbook, "Cross Border Fraud", A1:M6 (customer ID, IPTP "Corp", volume 1, bene_volume 1, value, outcome columns).
- CVOL proposal pages 26–28 (SRCHID 13441537, Corp cross-border, 6 August): one fraud, original C3 (held and stopped).
- Validation CSV rows 98–99 and 187–188 (RSK RED C BACKSTOP CrsBrd and CrsBrd 2: Green List <1, NewBeneDays <2) and row 456 (CrsBrd only: NumberAuthorizers <2). No amount instance is listed for either backstop.

Assumptions MRM has made. MRM has assumed that "Missed" means ROVA returned OK (C1/C11), and that "Detected - Released" means ROVA held the payment and it was released after review (C2).

Questions for UKXD.

1. For each of the three missed frauds, please give the date, payment details and the scenario conditions that were not met. Is each miss intended?
2. For the released fraud (£34,215), which scenario held it, and what did the post-event review conclude?
3. What are the amount thresholds of the corporate cross-border backstops? Would they have held each missed fraud?
4. Is the fraud in simulation 13441537 (6 August, C3) one of these five? If so, which one, and which scenarios held it?
5. Is there a tracked action on corporate cross-border coverage? Was this table presented to the CFCPO and MLRO with the change?

CB-4. Corporate "holds only" policy: no change record, and STOPs before August

Scope: change → model-wide · Priority: Medium · Validation component: Implementation and Use

What this is about. The JSON says every corporate scenario is now designed to give a HOLD rather than a STOP. That is a design decision that affects every corporate scenario. It changes both customer friction (a STOP is more disruptive) and fraud outcomes (after a HOLD, a person decides whether to release, and a fraud was released in CB-3).

The issue. There is no change record for this decision in the pack. The metrics workbook shows when it happened:

- CVOL CrsBrdMinAmnt raised 14 false-positive STOPs in June, 23 STOPs and 23 HOLDs in July, then only HOLDs (27 in August, 34 in September).
- Other corporate scenarios also stopped payments in June and July and not afterwards: RSK RED C CVOL CHPSMinAmnt (29 and 18 STOPs), ABNM RSK C D1 CrsBrdMinAmnt, ABNM RSK C D1 CHPSMinAmnt (including 3 frauds stopped in June), EXPB C D1 and RSK RED C UVOL GEN.

The pattern points to a change part-way through July. The 6 August simulation shows the corporate fraud as a STOP under the new control set, which does not fit "holds only" (see CF-2). The JSON is the only place the policy is written down.

Where it is (exact wording).

> "In this case the ROVA outcome will be HOLD, all corp scenarios are now designed to be holds due to the exceptional friction generated by STOPS."
> — CVOL JSON, field "fdesc"; CVOL proposal, page 2
>
> "RSK RED C CVOL CrsBrdMinAmnt | Last Month -3 | 14 | FP | STOP" · "Last Month -2 | 23 | FP | STOP" · "Last Month -2 | 23 | FP | HOLD" · "Last Month | 27 | FP | HOLD" · "Current Month | 34 | FP | HOLD"
> — Metrics workbook, sheet "6month rule data", rows 366, 64, 406, 358 and 277 (columns A–E; column E "Orignal_Hit_Type")

Detailed references.

- Metrics workbook, "6month rule data": corporate STOP rows for June ("Last Month -3") and July ("Last Month -2") for the scenarios listed above. No corporate STOP rows for August or September.
- CVOL proposal pages 26–28 (SRCHID 13441537): simulated STOP (C3 1.0 under "NBROFST").

Assumptions MRM has made. MRM has read "Orignal_Hit_Type" as the outcome ROVA returned for the alerted payment. MRM has assumed that "Current Month" is September 2026.

Questions for UKXD.

1. Please provide the change record(s), with approvals, that moved corporate scenarios from STOP to HOLD. When did it take effect, and which scenarios did it cover?
2. Was the effect on fraud outcomes assessed (frauds that would now be held and could be released)? Was the Payment Verification Team's capacity for the extra holds assessed?
3. Can any route still produce a STOP for a corporate payment (for example STOP-list scenarios)? Please reconcile this with the simulated STOP on 6 August.
4. Please add the policy to the model documentation.

CB-5. September results do not match the forecast reduction

Scope: change · Priority: Medium · Validation component: Implementation and Use

What this is about. The change document forecasts how many fewer false alerts each change will produce. The first full month after the change (September) can be compared with that forecast. UKXD has said a formal post-change review is planned (v1 ID 14). This query asks only about this change's figures.

The issue.

- **UHAMT** fell from 138 false positives in July (about 4.5 a day) to 16 in September (about 0.5 a day). That is in line with the forecast of 1–5 a day.
- **CVOL CrsBrdMinAmnt** raised 34 false positives in September (about 1.1 a day), against 46 in July (about 1.5 a day) and 27 in August.

The forecast reduction of 1–2 a day was close to the scenario's whole alert volume. On 5–7 August the simulations removed 5 corporate cross-border holds, while CVOL raised 7 alerts on those days. The observed fall is about 0.4 a day. MRM cannot normalise for corporate cross-border payment volumes, because the metrics workbook does not split volumes by method and segment.

Where it is (exact wording).

> "False positive reduction is simulated to be 1-2 per day due to the RSK RED C CVOL CrsBrdMinAmnt adjustment (simulated across 5th-7th of August)."
> — Change document, page 5, "Change Impact Summary"
>
> "RSK RED C CVOL CrsBrdMinAmnt | Current Month | 34 | FP" · "Last Month | 27" · "Last Month -2 | 46" · "Last Month -3 | 14"
> — Metrics workbook, sheet "Rule Data", rows 228–231

Detailed references.

- Metrics workbook, "Rule Data", rows 308–311 (UHAMT: 16, 60, 138, 92).
- Change document pages 4–5: CVOL daily crossover table (target hits 2, 2 and 3 on 5, 6 and 7 August). Page 8: "For Corps Cross Borders simulations show reductions of 2, 2 and 1".
- CVOL proposal pages 8–9, 23–24 and 26–27 (Corp cross-border simulations: C7 14 → OK 2; C7 9 → OK 1; C7 10 → OK 2).

Assumptions MRM has made. MRM has assumed that "Current Month" is September 2026 and complete. "Metric Data", row 2 shows 163,085 uninterrupted payments, close to August's 164,904.

Questions for UKXD.

1. Why has CVOL CrsBrdMinAmnt continued to alert at about 1.1 a day when the simulations removed most of its alerts?
2. Please give September's CVOL alerts with their TrntoNB and AmnttoNB values. Do they meet the new £10K condition? This would also confirm the configuration (CB-1).
3. Please give corporate cross-border payment volumes by month (June–September), so the change can be normalised.

Group GV. Both scenarios: governance, evidence and documentation

GV-1. Retaining scenarios that detect no fraud: no criteria, owner or review date

Scope: change → model-wide · Priority: Medium · Validation component: Model Framework

What this is about. Each scenario uses customer and Payment Verification Team time. A scenario that catches no fraud should be kept only for a stated reason, with a date by which it will be judged and the test it must pass. UKXD has said that scenarios are built "to what we see as opposed to theoretical cases" (v1 ID 10). UKXD has also said that how far rules should be changed when fraud volumes are low is an open debate (v1 ID 17).

The issue. Both scenarios in this change are kept although neither has a recent detection record, and neither has a review date or decision test.

- **UHAMT.** The metrics workbook shows 663 false positives and one true positive from March to September 2026. The change document asks "how much longer should it be assessed for before a decision can be made", but does not answer it.
- **CVOL CrsBrdMinAmnt.** It was added as "theoretical coverage". The change document says the gap it was built for "is not a option any more". It has raised 121 false positives and no true positives since June. 37 of those were STOPs of genuine corporate payments in June and July. Its new £10K limit could not be set from fraud data because "the pattern … hasn't occurred".

This conflicts with the principle UKXD stated in v1 ID 10. There is also no documented test for adding or keeping a theoretical scenario.

Where it is (exact wording).

> "The rule will be kept live for OOH periods (10pm – 9am) but again the question could be raised on what value it adds, a phased implementation approach of setting this rule to be OOH for now to some reduction in hours while allowing us to continue to monitor if it adds value but given the 4 months of data we now have on this rule how much longer should it be assessed for before a decision can be made."
> — Change document, page 3, paragraph after the "Hits" table
>
> "The scenario for cross border was added to add theoretical coverage in case we saw the attack spread to this mythology. Since then the min amount for Crop cross border has been dropped to 0.96p such that nearly all payments are in scope of the rules (99.94%) and as such this gap is not a option any more, however the rule was kept in place to cover the potential risk of low value cross borders being exploited by fraudsters."
> — Change document, page 3, "RSK RED C CVOL CrsBrdMinAmnt", paragraph 1
>
> "This scenario's design was not inspired by any particular case and is acting as a theoretical risk scenario."
> — CVOL JSON, field "evid_desc"; CVOL proposal, page 2
>
> "we try to build scenarios to what we see as opposed to theoretical cases"
> — Query Log v1, ID 10, developer reply, point 2

Detailed references.

- Metrics workbook, "6month rule data", UHAMT rows 19, 540, 295, 69, 411, 197, 344, 167, 654, 355, 275, 392, 173, 14 (FP by month and HOLD/STOP), and row 423 (TP).
- Metrics workbook, "Rule Pivot", row 30 (CVOL CrsBrdMinAmnt: 34, 27, 46, 14; grand total 121) and row 39 (UHAMT).
- Model documentation §2.1, step 12, and §1.6 (no bank-defined criteria for a successful rule).

Assumptions MRM has made. None beyond the month mapping in UH-3.

Questions for UKXD.

1. What are UKXD's criteria for (a) adding a scenario with no fraud evidence, (b) keeping a scenario that has caught no fraud for a set period, and (c) decommissioning one?
2. For UHAMT and CVOL CrsBrdMinAmnt, please give the review date, the test that will decide whether they are kept, and who will decide.
3. Was decommissioning CVOL CrsBrdMinAmnt considered, now that the minimum-amount gap is closed? If so, why was it rejected?

GV-2. Documents dated or edited after approval; checklist blank; validation timing

Scope: change · Priority: High · Validation component: Implementation and Use

What this is about. Approvers sign off what they are shown. For the record to be reliable, the documents in the change folder should be the versions the approvers saw, or any later edits should be recorded.

The issue. The documents in the pack were produced or edited after the sign-offs on 10–12 August:

- **Proposals produced on 15 September.** Both proposals say "Date produced: 2026-09-15", and the change document links to these files as "Updated proposals". It is not clear which proposal versions the CFCPO, MLRO and UKXD reviewers saw.
- **Appendix built after August ended.** The appendix's August column matches full-month figures from the metrics workbook (UHAMT 60, CVOL CrsBrdMinAmnt 27, RSK RED P CVAL 142 FP / 2 TP). The change's own raw extract, which runs to 9 August, has only 38 UHAMT payments in August. So the document was edited in September or later.
- **Checklist blank.** The "ROVA Checklist" table, which should list the scenarios added, removed or adjusted, has no entries.

- **Timing of the edits and checks.** The change log shows CVOL CrsBrdMinAmnt edited again at 10:27:07, after the control set was created at 10:19:30. The validation report gives only a date (2026-08-10), so it cannot be confirmed that validation ran after the final edit. The simulations (10:31–11:48) did run after it.
- **Rollback copy.** The rollback copy NIFA07-2026-08-10-11.52 was taken after the new set, from the same source (CURRENT-2026-07-28-09.34). This is reasonable only if the live set did not change between 11:52 on 10 August and go-live.

Where it is (exact wording).

> "Date produced: 2026-09-15"
> — UHAMT proposal, page 1; CVOL proposal, page 1
>
> "Updated proposals – \...\NIFA07-2026-08-10-10.19\RSK RED C CVOL CrsBrdMinAmnt_Proposal_2026-09-15.pdf ... \RSK RED P UHAMT_Proposal_2026-09-15.pdf"
> — Change document, pages 5–6, "Link to new Scenario Proposals"
>
> "Controlset: NIFA07-2026-08-10-10.19 created from CURRENT-2026-07-28-09.34" (10:19:30) · "Scenario RSK RED C CVOL CrsBrdMinAmnt updated" (10:27:07)
> — Change log, rows 3 and 4
>
> "Copy of Current Controlset Taken – Yes – Date – NIFA07-2026-08-10-11.52" · "Accepted By – Josh Young, Thom Parkes – Date – 12/08/2026"
> — Change document, page 6, "Signoffs and Implementation"

Detailed references.

- Change document pages 12–13, appendix "Table showing FPR by scenario for August, July and June".
- Metrics workbook, "Rule Data" rows 309 (UHAMT, Last Month, 60) and 229 (CVOL, Last Month, 27). "Rule Pivot" row 7 (RSK RED P CVAL, August, 142 FP, 2 TP).
- Change data workbook, "Raw Alert Data": 38 distinct UHAMT payments dated 1–9 August 2026.
- Change document page 6, "ROVA Checklist" (blank). Change log rows 1–12. Validation report page 1.
- The model documentation §5.1 uses this change's sign-off table as its worked example.

Assumptions MRM has made. MRM has assumed that no other version of the change document exists in the change folder.

Questions for UKXD.

1. Which versions of the proposals and the change document did the approvers see on 11–12 August? Please provide them.
2. What changed after approval and why? Is there version control or a rule on editing approved change documents?
3. At what time was the validation script run on 10 August? Did it reflect the 10:27 edit?
4. Was the live control set changed by anyone between 11:52 on 10 August and go-live? How is the rollback copy checked against the live set?
5. Why is the ROVA Checklist blank?

GV-3. Figures in the change evidence cannot be reproduced

Scope: change → model-wide · Priority: Medium · Validation component: Data

What this is about. Approvers rely on the tables in the change document. MRM checked them against the workbook supplied as their source and against the metrics workbook. UKXD has already accepted that pivot errors may occur in some changes and plans to standardise in Q1 2027 (v1 ID 8). This query asks only about this change's figures and the checks in place until then.

The issue. Four sets of figures in this change do not agree.

(a) Scenario hits on UHAMT payments. There are four different versions, and the change document's table matches none of the others. The typed table in the workbook has three scenario labels in the wrong rows (D7–D9). The pivot is built on "Raw Alert Data", which contains 89 exact duplicate rows out of 784, so it overstates hits.

Scenario	Change doc (p.2–3)	Workbook pivot (A4:B13)	Workbook typed table (D4:E13)	Distinct payments (MRM)
RSK RED P UHAMT	194	202	202	176
RSK RED P NBG Limit FP	91	78	78	71
RSK NBG Limit P FP	75	74	74	67
ABNM RSK P HAmntDev	66	71	66 (row 8)	62
RSK RED P CVAL	66	66	61 (row 9)	58
RSK RED P UVAL GEN	69	61	71 (row 7)	56

(b) Appendix against the metrics workbook. The appendix, titled "FPR", shows counts. Several of them are about double the monitoring figure for the same month: ABNM RSK P HAmntDev 563/565/540 against 282/292/285 for August/July/June; RSK NBG Limit P FP 513 against 239 in August. UHAMT July and June are 217/209 against 138/92. CVOL CrsBrdMinAmnt July is 60 against 46. UKXD stated in v1 ID 9 that counting is per payment; these figures are not consistent with that.

(c) Simulation count. The simulation summary says false positives on private Faster Payments fell by 5 on 6 August. The simulation itself shows 6 alerts moving to OK (C6 1 and C7 5).

(d) CVOL crossover average. "Avg 19%" is the simple average of the daily percentages (L16 = AVERAGE(L2:L15) = 18.7%). Weighted by alerts it is 11 of 55 = 20.0%. This is a minor point.

Where it is (exact wording).

> "Scenario | Hits: RSK RED P UHAMT 194 · RSK RED P NBG Limit FP 91 · RSK NBG Limit P FP 75 · RSK RED P UVAL GEN 69 · ABNM RSK P HAmntDev 66 · RSK RED P CVAL 66 …"
> — Change document, pages 2–3
>
> "Table showing FPR by scenario for August, July and June."
> — Change document, page 12, "Appendix"
>
> "Simulation results for Priv fasters show reductions of 3, 5 and 1 across the 5th,6th and 7th of August."
> — Change document, page 8, "Simulation Results"

Detailed references.

- Change data workbook, "Other Scenario Hits": pivot A3:B31 (source "Raw Alert Data"); typed table D3:E13, rows D7 ("RSK RED P UVAL GEN", 71), D8 ("ABNM RSK P HAmntDev", 66), D9 ("RSK RED P CVAL", 61).
- Change data workbook, "Raw Alert Data": 784 data rows, 695 distinct; for example TXNID 41469879563 appears twice for each of its two scenarios.
- Change data workbook, "Scenario Crossover", I1:L15 and L16.
- Metrics workbook, "Rule Pivot", rows 5 and 6 (HAmntDev, NBG Limit P FP); "Rule Data" rows 230 and 310–311.
- UHAMT proposal, pages 5–6 (SRCHID 13440209).

Assumptions MRM has made. MRM has treated the metrics workbook as the reference for monthly counts.

Questions for UKXD.

1. Please give the source and date range of the change document's "Hits" table and appendix, and provide corrected figures.
2. Why does "Raw Alert Data" contain duplicate rows? Is the same extract used in other changes?
3. Would the corrected figures have changed any conclusion in this change?
4. Until the Q1 2027 standardisation, what check (for example a second person reconciling change figures to the metrics workbook) is applied to the figures in change documents?

GV-4. Scenario descriptions do not match the configuration

Scope: change → model-wide · Priority: Medium · Validation component: Model Framework

What this is about. The JSON fields and the proposal text are the only written definition of each scenario. Reviewers and approvers use them to understand what is being approved. They should describe the configuration accurately.

The issue.

- **UHAMT trigger.** The JSON says the payment is on "the first day that bene is being used". The change document says "in 24 hours on the first 2 days of usage". The configuration uses NewBeneDays <2 and CounttoBene1Day >0. It is also not stated whether the earlier payment must itself be over £10,000, or whether held or stopped attempts count.
- **"Creation of a new scenario".** Both summaries say this, but the change is "Type: Adjustment". UHAMT was added in January 2026, and CVOL CrsBrdMinAmnt about 2.5 months before the change.
- **UHAMT evidence.** The evidence field says the scenario was not inspired by any case, but it lists case FRD0002290 (UH-3).
- **CVOL count.** "5 or more" against TrntoNB >5 (CB-1).
- **Corporate holds.** The corporate "holds only" policy is recorded only in a JSON field (CB-4).

Where it is (exact wording).

> "it will trigger on >10K payments by a Priv account user when they have already made at least 1 payment to the same new and unknown bene and it is the first day that bene is being used."
> — UHAMT JSON, field "fdesc"; UHAMT proposal, page 2
>
> "which triggers on payments exceeding £10,000 from a private account user who has already made at least one payment to the same new and unknown beneficiary in 24 hours on the first 2 days of usage"
> — Change document, page 2, paragraph 1
>
> "Creation of a new scenario looking at high value payments by a Priv Account user to new and unknown beneficiaries on the first day of usage (RSK RED)." · "Creation of a new scenario used to detect low value Corp Cross border payments…"
> — UHAMT JSON and CVOL JSON, field "summary"; proposals, page 2
>
> "Type: Adjustment"
> — Change document, page 1

Detailed references. UHAMT proposal page 3 (CounttoBene1Day >0, NewBeneDays <2, HighAmountDT x>£10k). Validation CSV rows 169 and 490.

Assumptions MRM has made. MRM has assumed that the proposal generator copies the "summary" text from when each scenario was first created.

Questions for UKXD.

1. Please confirm UHAMT's exact trigger: the beneficiary-age window (day 0 only, or days 0–1), whether "day" means a calendar day or a rolling 24 hours, and which earlier payments count.
2. Please update both JSON records so the summary, description, count and evidence match the configuration and the change type.
3. Is the "summary" field reviewed when a scenario is adjusted?

GV-5. Customer-identifiable data in the change evidence

Scope: change · Priority: Low · Validation component: Data

What this is about. Change evidence is shared with reviewers, approvers and MRM. It should contain only the customer data needed for the purpose.

The issue.

- "Raw Alert Data" holds customer and user IDs, sending and receiving account numbers, IBANs and payment free text for 176 payments.
- "Cross Border Fraud" holds customer IDs.
- The change document shows a named corporate customer's payment as an example.
- The workbook is named after CVOL CrsBrdMinAmnt, but most of it is UHAMT analysis.

Where it is (exact wording).

> Column headers "CUSTIPIDFR", "USERIPIDFR", "RECVACCTNBR", "SNDACCTNBR", "FREETX"
> — Change data workbook, sheet "Raw Alert Data", row 1
>
> "An example of the former behaviour is the below magazine publishing company that frequently trigger this rule."
> — Change document, page 4, top paragraph and the screenshot below it

Detailed references. Change data workbook, sheets "Raw Alert Data" (columns R–U, K, P) and "Cross Border Fraud" (column A). Change document classification: "Information classification: Confidential".

Assumptions MRM has made. None.

Questions for UKXD.

1. Is the use of account-level data in change evidence covered by a data-handling standard? Could the evidence use masked IDs?
2. Please confirm the retention and access rules for the change folders.

7. Items carried forward from Query Log v1

v1 ID	Topic	UKXD reply so far	What remains open	Where handled
18	Approvals for changes that reduce alerting	None	All of it	CF-1
11	STOP-list entries in simulations	Questions 1 and 2 answered; "Is it true?" not answered	Whether simulations use STOP-list entries added after the payment	CF-2
5	Hour of Day clock and BST	"CET time (we think)… to be raised with group"	Group's answer	CF-3, UH-1

v1 ID	Topic	UKXD reply so far	What remains open	Where handled
14	Post-change review	"planned as part of JIRA UKFCA 5915"; MRM guidance invited	Design and timing	CF-4, CB-5

CF-1. Approvals by change type (v1 ID 18, unanswered)

Scope: model-wide · Priority: High · Validation component: Implementation and Use

What this is about. Query Log v1 ID 18 asked why the June HAmntDev change, which reduced alerting, had no MLRO oversight row, and asked for the approvals required for each type of change. There has been no reply.

The issue. This change is also labelled "Adjustment" and also reduces alerting. Unlike the June change, it has both CFCPO approval and MLRO oversight. The two sampled changes therefore followed different approval routes for the same type of change. The model documentation requires CFCPO and MLRO sign-off for reductions.

In both changes, the same UKXD reviewers carried out the review, verified the thresholds and accepted the control set. The UHAMT change removes the scenario for most of the day (about 88% of its July–August alerts were in daytime). In effect it is close to a partial decommission. No change category for decommissioning exists in the sign-off table.

Where it is (exact wording).

> "CFCPO/MLRO sign-off is required for optimisation or reductions to alert levels - when doing one of these changes it is common to implement in a phased approach"
> — Model documentation, §2.1, step 12
>
> "CFCPO Approval (For reductions/Optimisation only) – Clare Wilson – Date - 11/08/2026" · "MLRO Oversight (For reductions/Optimisation only) – Natalie Gill – Date – 12/08/2026" · "UKXD Thresholds Verified – Josh Young, Thom Parkes – Date – 11/08/2026" · "Accepted By – Josh Young, Thom Parkes – Date – 12/08/2026"
> — Change document, page 6, "Signoffs and Implementation"

Detailed references. Query Log v1, ID 18 (developer columns blank). June change document, pages 3–4 (no MLRO row). Model documentation §5.1.

Assumptions MRM has made. None.

Questions for UKXD.

1. Please answer v1 ID 18: why does the June change have no MLRO oversight, when this August change does?
2. Please set out the approvals required for each change type: new, tightening, reduction/optimisation, partial removal (such as restricting hours) and decommission.
3. Is it acceptable for the same people to review, verify thresholds and accept a control set? If so, where is this agreed?

CF-2. STOP-list look-ahead in simulations (v1 ID 11, unanswered part)

Scope: model-wide · Priority: High · Validation component: Predictive Ability and Backtesting

What this is about. When a fraud is confirmed, the beneficiary's account is added to a STOP list. If a later simulation re-runs the original fraud payment against today's STOP list, ROVA will stop it. That is not because the scenario works, but because the system now knows the answer. v1 ID 11 asked whether this happens ("Is it true?"). The reply answered the other points but not this one.

The issue. This change gives new evidence. In the 6 August corporate cross-border simulation, the one fraud (held and stopped in reality, C3) comes out as a STOP under the new control set. CB-4 says all corporate scenarios now give HOLD only. A corporate STOP is therefore most likely to come from a STOP-list scenario (STOP AccNbr D or STOP AccNbr D GoL, both in this control set). The June change also had STOP outcomes from "STOP AccNbr". If simulations use STOP-list entries added after the payment, the fraud-detection results in every change pack overstate detection.

Where it is (exact wording).

> Original Results: C3 1.0, C5 552.0, C7 10.0 · Simulation Results: NBROFOK C7 2.0; NBROFHO C7 8.0; NBROFST C3 1.0
> — CVOL proposal (and UHAMT proposal), page 27, SRCHID 13441537, Corp – Cross Border Payments, 6 August 2026
>
> "(Assuming that the STOP-list entries were made after the frauds, as the change document states. - Is it true?)"
> — Query Log v1, ID 11, MRM observation

Detailed references. Validation report page 3 (STOP AccNbr D, STOP AccNbr D GoL in the control set). CVOL JSON "fdesc" (corporate holds only). Query Log v1 ID 11 developer reply (points 1 and 2 only).

Assumptions MRM has made. MRM has assumed that the simulated STOP does not come from a corporate scenario, given the holds-only policy.

Questions for UKXD.

1. Which scenario produces the STOP for the 6 August fraud in simulation 13441537?
2. Does the ROVA simulator use STOP-list and green-list entries as they stand today, or as they stood when the payment was made?
3. If today's lists are used, can fraud simulations exclude STOP-list scenarios, or show results with and without them?

CF-3. ROVA clock and BST (v1 ID 5, open with Group)

Scope: model-wide · Priority: High · Validation component: Model Controls

What this is about. In v1 ID 5, UKXD said ROVA runs on CET "(we think)" and that BST handling would be raised with Group. UH-1 shows that the answer decides whether UHAMT's window starts at 10pm or ends at 8am in UK time. It also affects eight other out-of-hours scenarios.

The issue. No Group answer has been provided. UK and Swedish clocks change on 25 October 2026 and again in March 2027. If ROVA follows Swedish local time, the offset to the UK stays one hour. If it uses fixed CET, or UTC, the offset changes with the seasons.

Where it is (exact wording).

> "ROVA is in CET time (we think). We do not know how ROVA handles BST changes - to be raised with group."
> — Query Log v1, ID 5, developer reply

Detailed references. UH-1. Validation report pages 26–27 (nine out-of-hours fails).

Assumptions MRM has made. None.

Questions for UKXD.

1. Has the question been raised with Group? Please give the reference, the answer, or the expected date.
2. Until the answer is known, will UKXD state each out-of-hours scenario's live hours in UK time, for both summer and winter, in the change document (as part of JIRA UKFCDA-7090)?

CF-4. Post-change review: MRM's expectations (v1 ID 14, planned)

Scope: model-wide · Priority: Medium · Validation component: Implementation and Use

What this is about. In v1 ID 14, UKXD said a post-change review is planned (JIRA UKFCA-5915) and asked for MRM's guidance. CB-5 shows why it matters: one of this change's two forecasts has held and the other has not.

What MRM expects the review to cover. This is for discussion, not a finding.

1. **Timing.** A first check at one month after go-live and a full review at three months. Each change document should state the review date.
2. **Measure.** Alerts and holds for each changed scenario, per 10,000 in-scope payments (by method and segment), before and after the change, compared with the simulated range. Separately, the alerts the scenario raised alone.
3. **Fraud side.** Frauds in scope of the changed scenario after go-live, including misses found from fraud reports. These should be compared with the fraud simulation in the change pack.
4. **Tolerance and action.** A stated tolerance (for example, outcome outside the forecast range for two consecutive months), with the action required and who owns it.
5. **Record.** The result filed in the change folder and reported at the bi-weekly review.

Questions for UKXD.

1. Please confirm the planned scope and timing of JIRA UKFCA-5915, and whether this change will be its first case.
2. Please comment on MRM's expectations above.

8. MRM's working assumptions in this log

#	Assumption	Used in	Effect if wrong
1	Hour of Day bands work as UKXD described in v1 ID 5.	UH-1, CF-3	The live hours would need recalculating.
2	EFFTMSTP in the DACO extract is UK local time.	UH-1, UH-2	The hour counts would move by one hour.
3	"Raw Alert Data" holds every UHAMT alert from 1 July to 9 August 2026.	UH-2, GV-3	The unique-hit counts may be understated.
4	Metrics workbook "Current Month" = September 2026, so "Last Month -6" = March 2026.	UH-3, CB-4, CB-5, GV-1	The month labels would shift.
5	"Orignal_Hit_Type" is the outcome ROVA returned for the payment.	CB-4	The STOP-to-HOLD timing would need re-reading.
6	Scenario conditions have been read from instance names, because thresholds and points are not in the pack.	UH-2, CB-1, CB-2, CB-3	Coverage conclusions may change. UKXD is asked to confirm.
7	The 5–7 August simulations reflect the final configuration (they ran after the 10:27 edit).	UH-2, CB-5	The simulated reductions may not apply.
